Documents 1-5 disclose a feature wherein a signal, which expresses the starting of recording or the stopping of recording, is recorded in a predetermined region when there is an instruction to start recording and/or stop recording. In addition, documents 6-8, which are newly cited in this international preliminary examination report, disclose the feature of recording a multiplexed signal in the frame where recording is stopped; therefore, it would be easy for a person skilled in the art to configure the inventions that are set forth in claims 1,

#### Claims 5 and 6

Document 2 discloses the feature of recording a mark identification code in 20 consecutive frames (paragraph [0015]). Document 2 does not indicate that the mark identification code is recorded when recording is stopped; however, the feature of recording a specific signal when recording stops is well known as disclosed in documents 1, 3 and 4.
